Expanding history

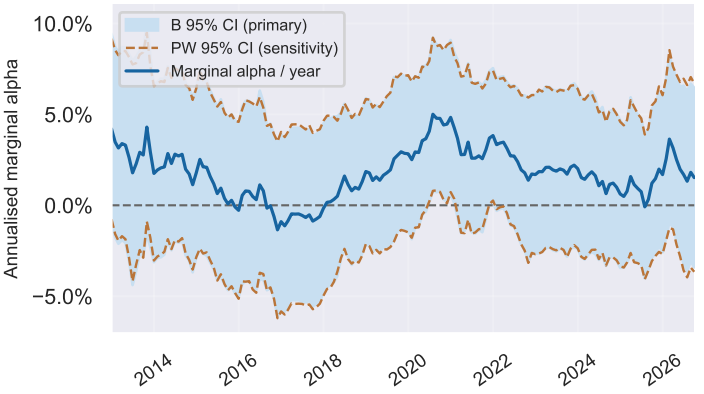

Expanding history

5-year rolling

5-year rolling

Strategy minus comparison portfolio: positive favours strategy. Simple total returns; zero cash assumed.
ΔAlpha = strategy return − comparison return − prior holdings beta difference × market excess return.
Paired HAC retains covariance. Betas: EWMA-demeaned instrument log returns; simple-return application is approximate.
Minimum N: Sharpe 24, alpha 24; each ≥24 and ≥2 years; HAC needs N ≥5(L+1). Automatic lags.
First jointly covered alpha return: 31Jan2008. No beta=1 prior, NAV regression, padded zeros or dropped interior gaps.
Expanding warm-up: normally 3 years. Rolling: 6 years at quarterly; otherwise 5 → 3 → 2 with warning. Existing NAV costs retained.
Pointwise asymptotic intervals, not simultaneous or selection-adjusted. Overlapping windows are dependent.
[1] Annualised mean residual difference; not pure manager skill or certainty about true beta. Coverage is not guaranteed.
Alpha only: B = Bartlett HAC; PW = AR(1)-prewhitened Bartlett. Same N/L; sensitivity p-values unadjusted; no method selection by p.
